Data protection and cyber security

The current situation

Ensuring the continuity of your company's access to and use of data and critical digital infrastructure is a core element of your company's business continuity.

Shifts in geopolitics affects compliance with data privacy- and cyber security laws. With a fast-changing legislation and an even faster changing threat landscape, companies need to prepare how the company will react to changes in law or cyber incidents materially impacting the company's access to and use of critical data and digital infrastructure.

Key challenges

The potential shifts in geopolitics affects global data flows and the cyberthreat landscape:

- How will invalidation of current data transfer schemes such as the EU-US Data Privacy Framework affect your company's critical data flows?
- Will geopolitical shifts affect the risks associated with off-shore service delivery models?
- How will the surge of new cybersecurity legislation entering into force across the globe affect your company?
- How will your company ensure that your digital supply chain meet future compliance requirements?

We can assist

We help clients identifying the risks to keeping critical data flows and digital infrastructure compliant, enabling your company to:

- Assess the risks associated with your company's global data flows and prepare your company's data continuity plans.
- Assess how shifts in geopolitics affect your company's compliance with cybersecurity legislation and what steps your company should take to mitigate and react to new threats.
- Implement the contractual measure throughout your company's digital supply chain necessary to handle new risks and threats.
